

The super notebook

Extra copies. Extra fast. Then it naps.

Copy the Voice-over block. Timed lines are for editing. No storyteller kid in the picture — voice only.

VOICE-OVER (COPY THIS)

Welcome back to Cloud Town, high up in the sky! This is Episode 12. RDS is a tidy notebook. Aurora is the super notebook. Extra copies. Extra fast. It still speaks MySQL. It still speaks PostgreSQL. All the notebooks share one big pile of pages. Write once. Everyone can read. Extra copies help the line stay short. Those are replicas. They share the same pile. When nobody writes, Aurora Serverless takes a nap. When Eddie writes, it wakes up. AWS grows the pages. Now you know Aurora!

TIMED LINES

0:00.10 – 0:04.38	Welcome back to Cloud Town, high up in the sky!
0:04.38 – 0:06.99	This is Episode 12.
0:06.99 – 0:10.08	RDS is a tidy notebook.
0:10.08 – 0:13.09	Aurora is the super notebook.
0:13.09 – 0:15.24	Extra copies.
0:15.24 – 0:17.26	Extra fast.
0:17.26 – 0:20.37	It still speaks MySQL.
0:20.37 – 0:23.67	It still speaks PostgreSQL.
0:23.67 – 0:28.11	All the notebooks share one big pile of pages.
0:28.11 – 0:30.00	Write once.
0:30.00 – 0:32.29	Everyone can read.
0:32.29 – 0:35.99	Extra copies help the line stay short.
0:35.99 – 0:38.31	Those are replicas.
0:38.31 – 0:40.92	They share the same pile.
0:40.92 – 0:45.53	When nobody writes, Aurora Serverless takes a nap.
0:45.53 – 0:48.80	When Eddie writes, it wakes up.
0:48.80 – 0:51.97	AWS grows the pages.
0:51.97 – 1:00.00	Now you know Aurora!

CHAPTERS

0:00.00 – 0:17.26	Super notebook
0:17.26 – 0:23.67	MySQL · Postgres
0:23.67 – 0:32.29	Shared pages
0:32.29 – 0:40.92	Replicas
0:40.92 – 0:48.80	Naps

0:48.80 – 1:00.00 Wakes up

NEIGHBORS (KID WORD = AWS)

Super notebook = Amazon Aurora

Extra copies, extra fast

Aurora is the super notebook. Extra copies. Extra fast. It still speaks MySQL and PostgreSQL.

Aurora is MySQL- and PostgreSQL-compatible and faster than RDS. Storage grows automatically. Use it when you want RDS-like SQL with more speed and replicas.

Shared pile = Aurora storage

Write once. Everyone can read.

All the notebooks share one big pile of pages.

Aurora storage is a shared cluster volume, replicated across Availability Zones. Writers and readers see the same pages. Storage grows in 10 GB chunks as you write.

Extra copies = Aurora replicas

They share the same pile

Extra copies help the line stay short. Those are replicas. They share the same pile.

Aurora replicas read from the same storage volume, so lag is tiny compared with RDS read replicas that copy the whole engine. Promote a replica if the writer fails.

Nap time = Aurora Serverless

Wakes when Eddie writes

When nobody writes, Aurora Serverless takes a nap. When Eddie writes, it wakes up.

Aurora Serverless v2 scales capacity up and down with load. It can scale toward zero when idle — a nap — then wake on traffic. Good for spiky or unknown workloads.

Tidy notebook = Amazon RDS

The cousin

RDS is a tidy notebook. Aurora is the super notebook on top of that idea.

Pick RDS for a simple managed engine (including Oracle or SQL Server). Pick Aurora when you want MySQL/PostgreSQL with shared storage, lots of replicas, and optional Serverless.

QUIZ

1. What is the super notebook that still speaks MySQL and PostgreSQL?

Choices: Super notebook · Tidy notebook · Nap time

Answer: Super notebook (Amazon Aurora)

2. What is one big pile of pages every notebook shares?

Choices: Shared pile · Tidy notebook · Extra copies

Answer: Shared pile (Aurora storage)

3. What are extra copies that share the same pile?

Choices: Extra copies · Tidy notebook · Nap time

Answer: Extra copies (Aurora replicas)

4. What takes a nap when nobody writes, then wakes for Eddie?

Choices: Nap time · Super notebook · Tidy notebook

Answer: Nap time (Aurora Serverless)

RECAP

Super notebook. Shared pile. Replicas. A nap, then a wake. Now you know Aurora.

Yes! Aurora is the super notebook. Shared pages. Replicas share the pile. Serverless naps, then wakes. AWS grows the pages.
